

MAVEN can read macro molecule in various formats, such as PDB, MTZ, PDBADD, XTZ, and BPDB. It supports visualization of macromolecular structure using UCSF Chimera visualization software. It also can visualize macromolecular structure in mol2 format. The latest version of MAVEN 1.6.8 is released on 2020/02/19. Q: How do I redirect all traffic to localhost? I'm using Apache VirtualHost to redirect all traffic to a special subdomain. My host machine has 2 network interfaces, 1 on the public IP, 1 on the local IP. ServerName foo.bar.com ServerAlias www.foo.bar.com ProxyPass / ProxyPassReverse / Options +FollowSymLinks +ExecCGI Order allow,deny Allow from all Everything works except that I can't access localhost (or the 127.0.0.1) server. I'd be happy to add exception rules to the Apache config, but that's probably unnecessary. I've tried adding to the hosts file: 10.10.10.10 localhost But that doesn't seem to work either. A: Do you run your virtual host on a separate network interface? Have you tried using the 127.0.0.1? Q: Passing a string parameter to a function in c++ Hi im trying to figure out the correct syntax for using a string as a parameter to a function, at the moment im just trying to pass a string with an 'x' in it. typedef void (\*myFunction)(const char\* param); void myFunction(const char\* param){ cout << 70238732e0 << <u>K1Gangster 720p Or 108041</u> </p></div>
